1 Introduction

jcgm is an open source Java implementation to interpret and render Computer Graphics Metafile (CGM) graphics files.

It is distributed as two packages, a **core** package released under the [Cougaar Open Source License](#) and an **image** package released under a BSD license.

The **core** package provides the basic interpretation and rendering functionality and the **image** package implements an [ImageIO](#) plugin for reading CGM files and an [XML Graphics](#) loader for displaying CGM graphics in a PDF file by using [FOP](#).

2 Feedback

Send feedback via the jcgm project page at Sourceforge: <http://sourceforge.net/projects/jcgm/>.

3 Acknowledgments

This library was originally developed by [BBN Technologies](#) and released as part of the [OpenMap](#) project.
